MegaStream - webOS UX Scenario

Release

Version 3.0.4 | uk.megastation.megastream | Megastation LTD, UK | support@megastation.uk. Target: webOS TV 7.0 (2022) and later, 1920 x 1080.

Service and pricing

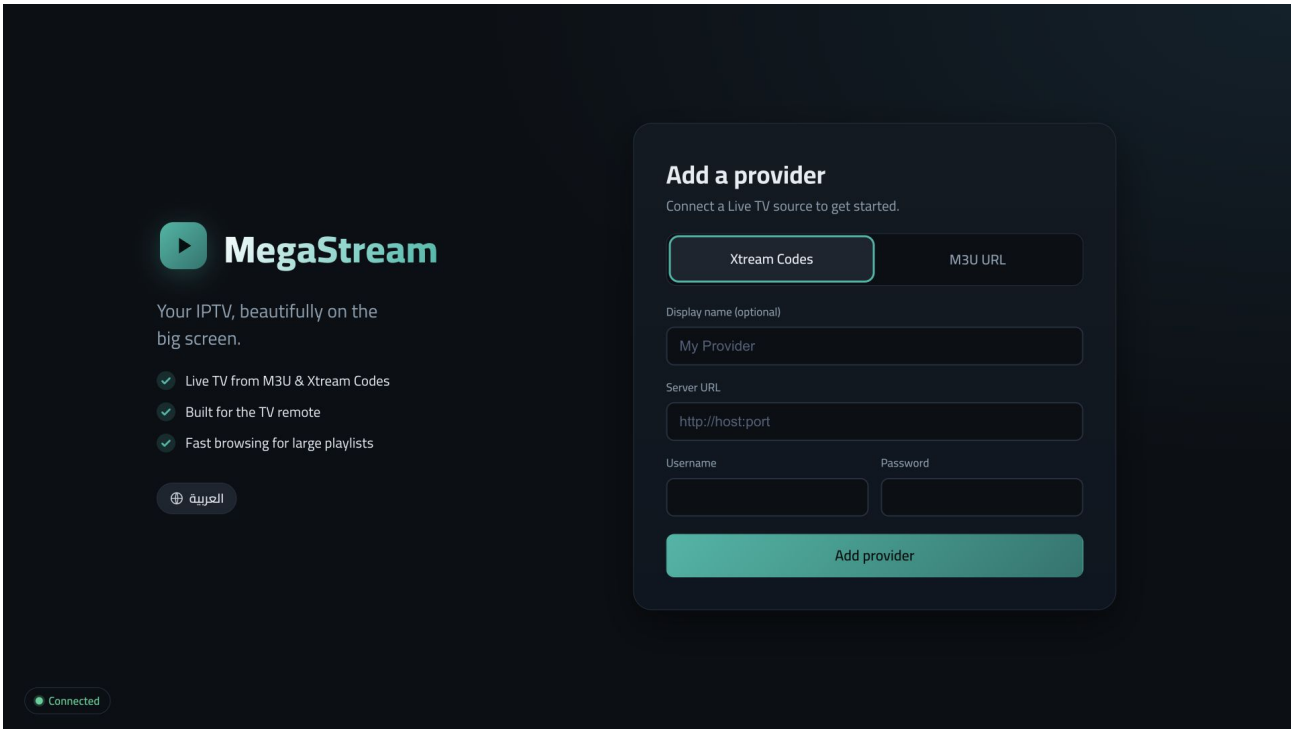

Free media player. No Megastation account, activation voucher, payment flow or embedded advertisements. No bundled channels, movies or subscription. Users must supply their own authorized content source; third-party providers may charge separately.

Remote controls

Arrow keys move focus. Enter selects a control or content item. Back returns to the previous screen. On-screen buttons also support pointer selection. English and Arabic are available.

Initial launch

With no saved provider, the source setup screen opens. Choose Xtream Codes or M3U. Saved provider settings and the language preference remain in local storage for later launches.

Source setup and navigation

Xtream Codes

Enter a provider name, server address, username and password for an authorized external IPTV service. Connect to validate the supplied account and load its available catalogue. These are provider credentials, not a Megastation login.

M3U playlist

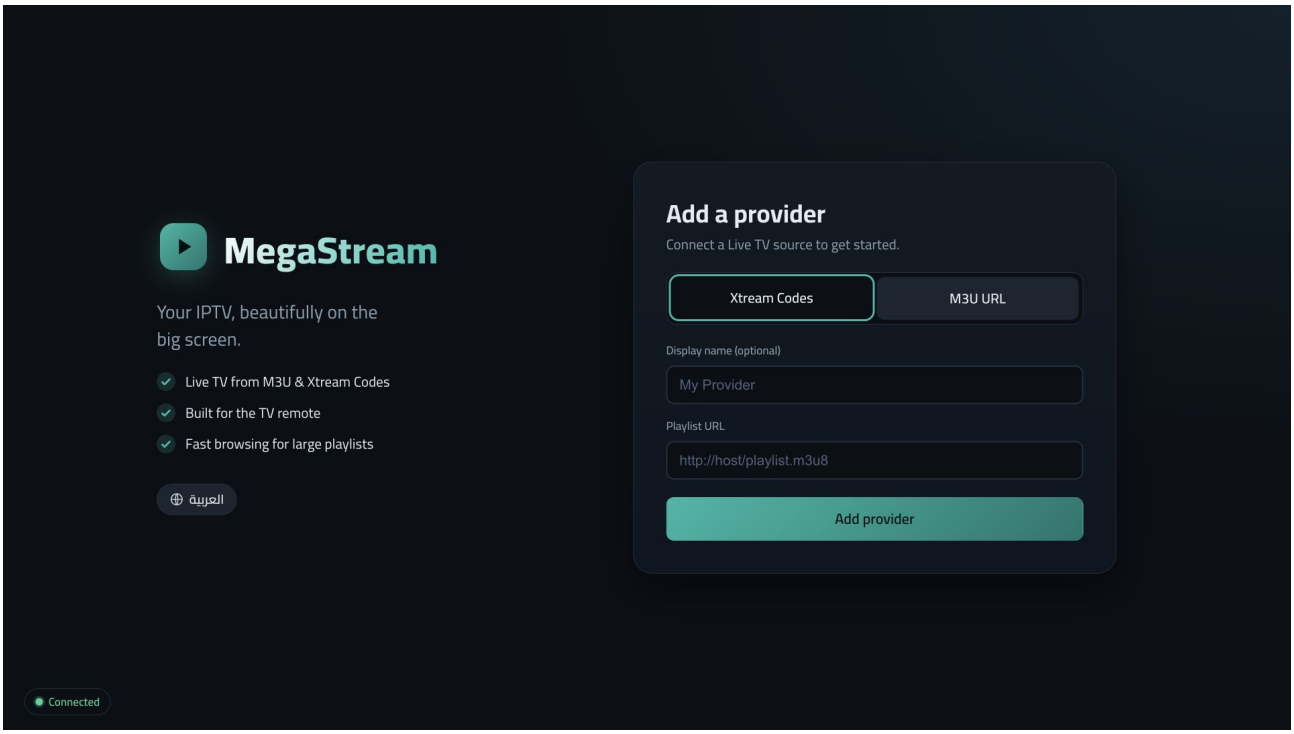

Choose M3U, enter a provider name and an authorized playlist URL, then connect. Availability and playback depend on the external source and the TV media capabilities.

Home and catalogue

Select Live TV, Movies or Series. Browse available items from the active provider and select an item to play. Series open an episode view. Change Playlist or Settings returns to source management.

Data handling

Source settings are stored locally on the TV. Requests to the user-selected provider are necessary to retrieve and play its content. Megastation states that it does not collect or share user data. No published privacy-policy URL was supplied for this submission.

Playback and reviewer prerequisites

Playback flow

Selecting a playable item opens full-screen video. The channel banner and Back button auto-hide after playback begins and reappear on a remote key press. Back returns to the catalogue or episode list. Playback errors display an error message and a return instruction.

Media implementation

HLS uses the native TV pipeline when available, otherwise hls.js where supported. Direct streams use the TV video pipeline. Codec support depends on the target TV; no device-specific codec or DRM certification is claimed.

Reviewer prerequisites

Provide an authorized M3U playlist or an external Xtream test account to exercise catalogue loading and playback. No reviewer content source or external test credentials have been supplied yet. No Megastation login or activation voucher is required.

Test status

The setup illustrations were captured from the local web application. No physical LG TV model or completed on-device QA result has been provided. This document describes the implemented workflow; it is not a certificate of successful TV testing.

Prepared 2 October 2026. Submission readiness remains pending reviewer content, physical-TV checks and required store assets.
